With DAM Capital, It's Possible!

Summary

With the Strait of Hormuz (SOH) effectively shut, repercussions are multifold if war sustains. We highlight the key global and Indian sectors impacted, with sensitivity of impact wherever possible:

A) Global impacts:

- Availability of oil is manageable to a certain extent but **oil products (LPG/ Naphtha/ ATF/Gasoil) would face challenges** as refinery runs fail to cope.
- **Natural Gas:** Gulf supplies > **20% world's LNG** and there are no spare capacities. Primarily used in power and industrial productions, countries have started rationalisation and switching to alternatives. Severe damage to Qatar's LNG terminal to affect Europe much more than India, ref slide 28.
- **Helium:** Gulf supplies > **1/3rd of Helium** – **Korea/Taiwan chip foundries to be impacted**, post their current inventories (3-6 months) are over
- **Sulphur:** Gulf accounts for **45% of total global exports:** this would starve the global **fertilizer** and **mining and metals processing, and uranium extraction** industries, leading to a surge in food prices and a slowdown in mining operations worldwide.
- **Methanol:** Gulf controls **~30% of global production** - particularly devastating for China, receiving over **75% of Iran's methanol exports** which is a foundational chemical for **plastics, paints, fuels**, and increasingly in **marine, automotive, and power applications**. The ripple effect would cause sharp price spikes across multiple industries.
- **Aluminium:** Gulf produces **9% of the world's total aluminium** and represents **22% of the supply outside China**. Europe and U.S. are heavily dependent on this for **automotive and packaging** sectors. Construction, cabling, and electrical infrastructure would also be impacted.
- **Fertilisers:** Over 30% of global urea and ~ 20% of ammonia and phosphate trade move through SOH, creating direct food-price and security risk

B) India impacts:

- **India macro impact:** Every \$ 1 bbl (vs. the budgeted \$ 70/bbl) increases Indian Govt's deficit by Rs 100bn – may widen CAD to 1.5-2.0% in Q1 FY27 (vs 1.3% in Q3FY26). A sustained >\$80/bbl crude can lead to CPI > 4.5% and INR can depreciate beyond 95.

	Crude Oil	LNG	LPG
Import dependency %	87	50	67
Thru Hormuz St (of the above) %	54	60	90
Storage capacity (days)	40	<5	15-20

- Fertiliser production at risk, esp Urea (however can import from Russia as its thru Suez, not SOH: currently it supplies over a third of MOP & 10-15% of Urea & DAP).
- Availability of oil and most oil products is not a material issue as we have domestic & alternative import sources. Natural gas is also manageable but with some rationalization. With high import dependence and limited inventories, **LPG and Bitumen availability remains critical. Impact on other Indian sectors enclosed.**

Trade routes in Gulf

Alternative routes

- Strait of Hormuz (SOH) mainly impacts India's trade (both exports & imports) from the Gulf. SOH remains the chokepoint for 20 mnbpd of oil & oil product imports. Our exports to the Gulf average \$ 60 bn p.a. with agri, gems & jewelry and engineering goods being the top commodities.
- Red Sea access to Suez is largely for our access to Europe, US & Russia which the Houthis have kept open due to Gaza ceasefire. Hence fertilisers from Russia & our exports of gems, petro products, textiles to these geos are safe for now. High value container traffic has been moving around the Cape of good hope for nearly a year due to Houthi risk
- East-west Saudi pipeline and Fujairah port offset some of this bottleneck but still 15 mnbpd of shipments remains challenged

Dependency on Strait of Hormuz

Table 1: India's and world's dependence on key hydrocarbons

Particulars	LNG (MMT)	LPG (MMT)	Oil (mbpd)
India's total consumption	54.4	31.0	5.5
Of which imported	26.5	21.0	4.8
<i>Dependency</i>	<i>49%</i>	<i>68%</i>	<i>87%</i>
Imports via Strait of Hormuz	15.9	18.9	2.6
<i>Strait as % of India's imports</i>	<i>60%</i>	<i>90%</i>	<i>54%</i>
Strait as % of India's total consumption	29%	61%	47%
Inventory with India (days)	4-5	15-20	40
Total consumption in world	3,095	345	104
Of which, traded via sea	410	140	80
Of which via Strait of Hormuz (net)	82	45	8
Strait as % of total seaborne exports	20%	32%	10%
Strait as % of total consumption in the world	3%	13%	8%

Table 2: India's key oil products exports/imports

Commodity	Production	Consumption	Export/ (Import)
Oil	29.9	270.0	-240.1
Natural Gas	27.9	54.4	-26.5
Oil products -			
Petrol	48.1	40.0	8.1
Diesel	118.0	91.4	26.6
LPG	12.8	31.3	-18.5
ATF	17.8	9.0	8.8
Bitumen	5.3	8.3	-3.0
Petcoke	15.0	22.1	-7.1

Products Flow Chart

Summary of Impact on Sectors ...

NOTE: war beyond 2 months will impact ability to pass on costs which will rise dramatically and supply issues beyond current inventories; ST inventory gains.

- **O&G:** Upstream oil & gas companies benefit while all downstream companies suffer. OMCs have limited pricing power to pass on the elevated oil prices (note 4 elections this year) and are the worst impacted companies of the lot. Severe damage to Qatar's LNG terminal to affect Europe much more than India, ref pg 28.
- **Infra:** Govt's potentially lower capex spend vs. the budget and a slowdown in ME execution as well as ordering, to negatively impact Infra Cos.
- **Airlines:** ATF accounts for ~35-40% of total cost; for 10% increase in ATF prices, EBITDA hit is ~15%. Airspace shutdown in Middle-East combined with re-routing of long-haul flights would impact earnings (difficult to ascertain impact).
- **FMCG:** Crude-linked packaging costs — PET chips, liquid paraffin, HDPE, and flexible laminates — together account for ~15% of total operating costs. Margin Pressure likely if elevated crude prices persist for 1–2 months (specifically from Q1FY27 onwards). Leading players can increase market share as more able to pass on costs vs. unorganised sector
- **Alcobev:** Glass manufacturing relies heavily on natural gas to fire furnaces (spirit/ beer bottles are 20%/ 40% of total RM costs) – after 2 months' current inventory exhausts, margins will be impacted.
- **Textile:** Disruption in supply of MEG and PTA (key raw materials for polyester yarn): polyester yarn (> 1 month inventory currently) prices have risen by ₹20–25/kg (~15–20%) resulting in inventory gains in near term, which also led to a rise in cotton yarn spreads – benefiting cotton yarn (currently 3-6 months' inventory) companies
- **Cement:** No impact on supply chain as no pet-coke / coal is procured from ME. But a 10% increase in International pet-coke and coal prices leads to ~8% contraction in EBITDA/t, i.e. Rs.130/t. Additionally, increase in polypropylene prices (raw material for bags) can impact EBITDA by Rs 80/t.
- **Home Improvement:** 10% increase in crude-linked inputs and no price-hike pass-through means tiles EBITDA margins drop by 70-150 bps, while for Wood Panels, margins drop by 30-60 bps is possible. For pipes, margin impact is minimal (given near certainty of 1:1 pass-through).
- **Sugar:** Higher sugarcane diversion towards ethanol in Brazil (season starts in April), leading to an increase in sugar prices – likely to aid Indian exports. Also higher crude prices may prompt the GOI to accelerate the ethanol blending programme from current 20% level

Continued ...

... Summary of Impact on Sectors

- **Fertilizers:** This is an input-cost and logistics shock, not a near-term availability crisis: supplies are comfortable for now; DAP is most exposed on import dependence, Urea is already seeing some production cuts due to gas shortages. If disruption persists into kharif, landed costs, sourcing risk and subsidy pressure will rise, with any near-term inventory gains likely offset by higher replenishment costs—favoring players with stronger sourcing and inventory positions. Fertiliser production at risk, esp Urea (however can import from Russia as its thru Suez, not SOH: currently it supplies over a third of MOP & 10-15% of Urea & DAP).
- **Auto:** Urea shortages could disrupt cargo movement (additive in diesel vehicles for exhausts) and constrain production at forging and casting companies (gas usage). Higher commodity prices would put pressure on tyre manufacturer's margins
- **Chemicals:** Most chemical chains with crude-linked inputs eventually pass through cost inflation, but this usually comes with a quarter lag. If disruption lasts beyond a few weeks, the market focus will likely shift from price hikes to sourcing risk, plant run-rates and spreads.
- **RAC & EMS:** LPG shortage and commodity (resins, gases) inflation has created temporary disruption to RAC production during the peak manufacturing period, albeit the impact will be higher on EMS vendors vs. RAC brands. Industry has been agile to shift to alternate fuels like oxyacetylene, PNG etc for incremental production though brands are watchful of production at elevated prices. Any prolonged disruption could create bottlenecks to production and tighten supply chains. EMS players are largely insulated for its exports till now as shipments are largely moving through unaffected sea routes, though risks could spill into 1Q27 if disruptions persist.

MACRO IMPACT

World oil/ oil product availability dynamics

- **Oil: Manageable:** A total of ~10 mnbpd (million barrels per day) of net oil flow from the Strait of Hormuz has been impacted but likely manageable in the near-term - Total world oil inventories are decent 8.2bn bbls (90-100 days of world's refining requirement); IEA releasing 400 mn bbls of crude oil (50 days of volumes being disrupted); and Russian inventory on sea also now being available (2 mnbpd rate currently of total of 150 mn bbls). China's oil reserves of >1.2 bn bbls – providing import cover of ~120 days.
- **Oil products (Naphtha, gasoil, jet fuel, fuel oil, etc): Challenging:** 5.0 mnbpd (5% of world's consumption) of oil products exported via the Strait at risk over and above the oil flows. Some spare refining capacity available (>15 mnbpd) but availability of crude for all of them may be difficult. Strategic oil product stocks available would ensure no shortage of products in the short-term but things to get incrementally challenging.
- **NGLs (Propane/Butane mainly): Challenging:** with ~13% of world's exports flowing via SOH, replacement would be difficult.
- **Natural gas (LNG): Challenging:** With > 20% of LNG being transported via the Strait and other LNG plants already running at ~100% capacity, there is no way to increase production. Countries are rationalizing their gas usage and moving to coal and nuclear for power usage. Severe damage to Qatar's LNG terminal to affect Europe much more than India, ref pg 28.
- **Petrochemicals:** 7-8% of world's Polyethylene / Polypropylene (PE/PP) is supplied by ME. While there are alternate routes vs SOH, capacity would be limited and refinery shutdowns could mean production could curtailed.

Facilities damaged so far

Facilities hit in the war so far

Country	Asset	Capacity
Oman	Duqm Port	Major storage hub
Saudi Arabia	Ras Tanura Refinery	550 kbpd
Qatar	Ras Laffan LNG Complex	77 MTPA
Israel	Bazan Refinery	197 kbpd
UAE	Fujairah Oil Storage Terminal	12 mn bbls
Iraq	Basrah Refinery	280 kbpd
Bahrain	Sitra Refinery	405 kbpd
Kuwait	Al-Zour Refinery	170 kbpd
Iran	Tehran Refinery Storage Tanks	200 kbpd
UAE	Ruwais oil refinery	922 kbpd
Oman	Port of Salalah	Major storage hub
Saudi Arabia	Shaybah oilfields	1 mbpd
Iraq	Lanaz refinery	75 kbpd
Iraq	Basrah Oil Terminals	3.3 mnbpd
Iran	Kharg Island Export Terminal	2 mnbpd
Iraq	Majnoon Oilfield	240 kbpd
UAE	Shah Gas Fields	1.28 bscf/d
Iran	South Pars Gas Fields	24.7 bscf/d
Qatar	Pearl GTL Facility	140 kbpd of GTL
Qatar	Ras Laffan Industrial City Gas Facility	77 MTPA
Kuwait	Mina Al Ahmadi Refinery	346 kbpd
Kuwait	Mina Abdullah Refinery	454 kbpd
Saudi Arabia	SAMREF (Yanbu) Oil Refinery	400 kbpd
UAE	Habshan/Bab Gas Fields	6.1 bscf/d

Segment wise impact

Facility Type	Units	Capacity
Refinery	kbpd	3,799
LNG Facility	MTPA	77
Oil Storage Terminal	mn bbls	12
Storage Tanks	kbpd	200
Oilfield	mnbpd	1.24
Export Terminal	mnbpd	5.30
Gas Fields	bscfd	32.1
GTL Facility	kbpd	140

Global Sectoral impact

- **LNG to impact chip foundries Korea/Taiwan:** Japan, South Korea and Taiwan are key LNG dependent countries with Qatar dependency of 5/15/35% respectively and maintaining gas inventories of – 22/25/10 days respectively - alternate power sources being tapped into. Chip foundries remain vulnerable.
- **Helium availability to impact the foundries:** Qatar supplied 1/3rd of the total Helium in the world with US and Russia being the other key suppliers. Replacement is almost impossible in the short-term as logistics are difficult. Taiwan/ Korea use Helium in the chip manufacturing facilities and likely have 3-6 months of stock. Beyond which, things will get difficult. Optical fiber production is the other key industry where Helium is needed for production – alternatives available but not sufficient.
- **Sulfur:** While the Gulf produces about **21.6%** of the world's sulfur, it accounts for a staggering **45% of total global exports**. This would starve the global **fertilizer** and **mining and metals processing, and uranium extraction** industries, leading to a surge in food prices and a slowdown in mining operations worldwide. Subsequent slide provides India impact
- **Methanol:** With the Gulf controlling **32%–35%** of global production, a closure would likely result in a **20%–30% drop in global supply**. This would be particularly devastating for China, which receives over **75% of Iran's methanol exports**. Since methanol is a foundational chemical for **plastics, paints, fuels**, and increasingly in **marine, automotive, and power applications**, the ripple effect would cause sharp price spikes across multiple industries.
- **Aluminium:** The region produces 9% of the world's total aluminum and represents **22% of the supply outside of China** - exporting to Europe and the U.S. are heavily dependent on this "non-China" **supply for automotive and packaging** sectors. Aluminium demand is concentrated in **transport, construction, packaging, cabling**, and electrical infrastructure.
- **Fertilisers:** Over 30% of global urea and ~ 20% of ammonia and phosphate trade move through SOH, creating direct food-price and security risk.

Sulphur and Sulphuric Acid – India impact

Sulphur

- India remains materially dependent on imported sulphur, with roughly 77% of Jan-Sep 2025 imports sourced from the ME.
- The impact is already visible in higher sulphur prices and tighter procurement conditions.
- Buyers have started shifting some volumes toward Russia and other non-traditional origins. But this is only a partial fix, as it reduces concentration risk while increasing freight, working-capital needs, and landed cost.
- Global trade has also turned more cautious, with buyers and sellers waiting for better clarity before committing fresh volumes.

Sulphuric Acid

- Better cushioned because India has a large domestic acid base and is adding captive capacity.
- Risk is therefore more company-specific, with merchant-acid buyers more exposed to replacement-cost and logistics risk, while backward-integrated players are better placed.

Product Category	Key Sulfur Role	Examples
Fertilizers	Sulfuric acid production	Phosphates, sulfates
Rubber	Vulcanization	Tires, elastomers
Chemicals	Compounds like sulfites	Detergents, dyes
Agriculture	Pesticides, fungicides	Crop protection

Dry bulk movement

- Strait of Hormuz is currently impassable for commercial shipping impacting direct trade with Middle East. However, all other trade globally is re-routed via Cape of Good Hope (Africa) which remains unimpacted.
- Commodities directly impacted due to closure of SOH include chemicals, food (fruits, vegetables, meat), pharma etc.
- For Russian crude/ fertilisers, Vladivostok (East coast) offer a viable alternative supply route to India that bypasses both Hormuz and the Red Sea entirely.
- No increase in container freight index until now due to Middle East conflicts and no port congestions.

India oil/ oil products availability dynamics

Availability -

- **Oil – manageable:** Availability from Russia and from SPR release from IEA should ensure adequate oil availability.
- **Oil Products (ex LPG) – manageable:** India is surplus on transport fuels (diesel/petrol/ATF) and hence no volume impact likely. However, Bitumen from ME would be impacted, affecting the roads segment.
- **LPG – Challenging:** Availability remains tight for the product (~15 days of inventory). US is the second biggest exporter but transit time is >30 days. A couple of cargoes left from ME but those account for only 1 day of India's consumption.
- **Petrochemicals:** With LPG being prioritised, gas being diverted from petchem use cases, petchem production will be impacted and prices may also remain elevated. Imports would also be challenging.
- **Natural gas (LNG):** Some of India's imports would be offset by procuring spot cargoes at higher prices but a total offset is less likely – Industrial units to be impacted by supply constraints.

Pricing impact -

- **Petrol/ diesel:** Current petrol/diesel marketing margins are ~ Rs (30)/ltr – extremely difficult to pass on to the end consumers – OMCs to bear most of it initially but eventually govt maybe forced to reduce the excise duty. Fiscal budget was broadly at \$ 70/bbl - every \$ 1/bbl impacts India by Rs 100bn – implying an impact of Rs 2.0trn at \$ 90/bbl avg oil price.
- **LPG:** Rs 60/cyl price hike has been taken but still under-recovery is more than Rs 300/cyl (i.e. Rs 600bn p.a) – initially to be borne by OMCs but to be reimbursed to some extent by the Govt.
- **Other products:** ATF, petchem, bitumen, fuel oil, naphtha, etc – All other crude derivatives are B2B and are freely priced and will be passed on to the users. All end user industries using these to be impacted.

External sector to face headwinds earlier

- If the war prolongs, resulting in crude prices sustaining above \$85-90/ bbl in long run, it should stress both CAD and Fiscal deficit.
- \$1/ bbl increase adds roughly Rs100 bn to the fiscal deficit. This may disturb the fiscal consolidation path, limiting policy flexibility in FY27. However, an immediate control over oil price volatility should not have a significant impact on Indian macros.

Impact on key Macros:

- **CAD:** Higher oil import bill likely to push CAD to 1.5–2.0% of GDP in Q1 FY27 vs. 1.3% in Q3 FY26 (Per \$10/ bbl increase = 0.3-0.5% CAD/ GDP). This will add renewed pressure on Rupee to depreciate to 95 in Q1FY27. Any RBI intervention should likely curb further depreciation.
- **CPI:** Considering RBI estimate at \$10/ bbl = +30bps WPI/ CPI, CPI likely to have an upside upto 4.2% only if govt opts for pass through (unlikely, esp. given elections), but it will weigh on FY27 fiscal math.

Macro Indicator	Implications
Crude Oil (Brent)	• India's crude basket moved from USD 69 to USD 104 just in two weeks because of Hormuz closure disruption. • As a result, we expect oil import bill to surge in coming months if war related volatility intensifies. However, India has oil reserves of 40 days
Trade	• Currently, shipping rerouted via Africa adding 15-20 days; For Suez (Houthi threat), high value container traffic has been through the cape for over 9 months ever since the Houthis choked it. • Freight & insurance costs likely to spike 2x due to stagnancy in trade movements.
USD/ INR	• As of today, rupee is at record low at 93.2. Expect RBI intervention as forex reserves are above USD 650bn. FY27E : 93-95 • On the other hand, if oil sustains ~USD 100+; twin deficits will be under pressure (CAD + FD).
Remittances	• A share of remittances worth USD 51bn/ yr from Gulf (38% of total USD 135bn) likely to be at risk.
Current Account Deficit (CAD)	• CAD may widen to 1.5-2% in Q1 FY27 of GDP from 1.3% in Q3FY26 mainly due to Rupee Depreciation and surge in oil prices (Per \$10/bbl increase = 0.3-0.5% CAD/GDP).

Macro fundamentals unlikely to take a backseat unless war prolongs

Macro Indicator	Implications
Inflation	- On 3rd March, LPG prices were hiked by Rs 60/cyl as international prices went up and supplies challenged - India's current crude basket at an avg of \$110 /bbl. Therefore, assuming RBI estimate at \$10/bbl = +30bps WPI/CPI, CPI likely to have an upside up to 4.2% only if govt opts for pass through. - In medium term, if oil sustains at \$ 100/bbl+, food inflation may surge due to price hike in farm inputs led by fertilizer shortage & higher transport costs. In turn, CPI may breach 4.5%.
Repo Rate	- RBI likely to pause at 5.25% in H1FY27 while MPC will be in wait & watch mode for oil prices trajectory and its pass through. - Moreover, rupee depreciation adds to imported inflation. Then, we expect India rate cuts post 2026. - If CPI breaches 4.5%, rate hike possibility will emerge again , depending on war related developments.
Fiscal Deficit	- Oil & fertilizer subsidy bill will rise if war prolongs for more weeks but limited fiscal impact if war is for a month. - In other scenario, if war prolongs for more than a quarter, Fiscal deficit may widen by 10-20bps only if capex is prioritized. - In that case, petroleum subsidy may increase by Rs 50-100 Bn; fertilizer subsidy up Rs 30-50 Bn (sulphur/urea shortage).
Gross Domestic Product (GDP)	- Limited impact in near term. If war sustains for more than a quarter, growth moderates to 6.8% from 7% estimate for FY27. - Increase in manufacturing input costs; export growth may slow and consumption may squeeze due to higher fuel/food costs.
Capex	Project cancellations unlikely with immediate effect but project costs likely to rise on higher input prices (steel, cement energy-intensive) in medium term.

INDIA SECTORAL IMPACT

Airlines

Airlines- Impact on the sector due to Iran war on two folds:

- **ATF prices:** directly linked to crude oil prices. ATF accounts for ~35-40% of total cost for airline industry. For 10% increase in ATF prices, EBITDA hit is ~15%.
- **Volumes:** airspace shutdown in Middle-East combined with re-routing of long-haul flights would impact earnings as well (difficult to ascertain the impact).

Kunal Shah: +91 22 42022578; kunal.s@damcapital.in

AlcoBev

- For Alcobev, the key monitorable is glass bottle costs — glass manufacturing relies heavily on natural gas to fire furnaces, and any sustained gas price spike directly impact bottle costs.
- Radico Khaitan is relatively insulated near-term — captive power plant operations are unaffected and PET resin exposure is negligible this quarter. Allied Blenders has 1-1.5 months of glass inventory providing a near-term buffer. Impact on glass bottle costs across the sector will only materialize if gas prices stay elevated beyond April-2026.

Automobiles

- **Urea shortage can impact cargo movement:** India imports 50-60% of technical grade Urea (TGU) requirement from hubs in Egypt and Dubai. TGU is used in diesel exhaust fluid (DEF) which is injected into exhaust stream of diesel vehicles equipped with selective catalytic reduction (SCR) system to convert harmful nitrogen oxides into nitrogen and water. All BSVI compliant heavy-duty trucks and buses; large diesel PV (typically >2.0L engines) are equipped with mandatory engine interlock mechanism under which vehicle cannot operate if DEF levels are exhausted. DEF is stored in a separate tank and needs to be refilled less frequently, typically every 3-4 diesel fill-ups. SIAM has raised concerns with the government that there is no clear visibility of urea supplies beyond early Apr'26. A disruption in DEF availability could lead to the immobilization of a significant portion of the commercial diesel fleet, disrupting logistics operations, the movement of essential goods, and overall supply chains.
- **Increase in crude prices is negative for domestic tyre manufacturers:** Since, crude oil derivatives like synthetic rubber, carbon black and various chemicals together constitute 40-45% of the RM mix. Additionally, natural rubber prices have also been rising (accounting for ~30%), partly due to inflationary pressures and logistics cost. If these conditions persist longer, it could significantly impact the margins of tyre companies.
- **Auto component manufacturers involved in forging and casting are highly vulnerable** to gas supply disruptions due to their dependence on gas-fired furnaces for heating processes. Such disruptions could affect the production of critical components like engine parts, transmission systems, and suspension parts, impacting multiple OEMs. While the near-term impact is manageable, prolonged disruptions could have a significant effect on the automotive supply chain

Cement

- **No impact on supply chain** as cement players do not procure pet-coke and coal from Middle East.
- **Impact: Price increase on fuel** front (pet-coke and imported coal) and polypropylene (used as a raw material in cement bags)
- Every 10% increase in pet-coke and imported coal prices is estimated to translate into an approximate 8% contraction in EBITDA/t. Overall impact of Rs.130/t in 1QFY27E led by:
 - Pet-coke price increase of ~7-8%qoq to US\$135/t.
 - Imported coal price increase of 16-17%qoq.
- Tight availability of plastic packaging bags and increase in polypropylene prices (key raw material for bags), resulting in an additional cost pressure of ~Rs.80/t in 1QFY27E.

- Q4/Q1 may see inventory gains for players holding low-cost inventory, as spot prices move up first.
- Bigger risk is replenishment. Once current inventory is exhausted, higher raw material, limited availability, freight and insurance costs can compress margins.
- Most chemical chains eventually pass through cost inflation, but this usually comes with a lag, so near-term earnings can still be volatile.
- Most exposed chains: methanol, ammonia and crude-linked petrochemicals such as ethylene, propylene, benzene and toluene, plus downstreams.
- Globally, buyers are delaying decisions, and parts of the polymer / petrochemical market have already seen offers withdrawn or paused
- If disruption lasts beyond a few weeks, the market focus will likely shift from price hikes to sourcing risk, plant run-rates and spreads.
- Companies with domestic integration, lower Middle East dependence, and stronger pass-through ability are better placed.

Fertilizers

- The current disruption is an input-cost and logistics shock, not an immediate availability crisis.
- Near-term supplies remain comfortable. This is also a lean demand period, with kharif demand typically building from mid-May, which gives some near-term cushion.
- DAP remains the most exposed due to import dependence and import-chain vulnerability. In urea, some plants have already cut utilisation / advanced shutdowns due to gas shortage. SSP and NPK players look relatively better placed for now, with stronger finished-goods and raw-material cover.
- **Key impact** if disruption persists- higher landed cost, weaker import economics, subsidy pressure, tighter sourcing, and more cautious inventory decisions.
- **Sales/ Profitability** – While prices are indirectly regulated, some windfall gain expected from liquidation of existing inventory in Q4/Q1. Inventory gains / subsidy support may be offset by higher replenishment cost. Kharif NBS rates remain a key monitorable.
- **Likely outperformers:** players with better RM sourcing, stock turns, and sales timing.

DAP: Import-chain stress / highest risk

- Structurally import-dependent, with the main vulnerability being the import chain.
- Saudi supply is strategically important, but Hormuz-exposed. China is no longer a dependable fallback. Morocco, Jordan, and Russia remain alternatives, but each comes with either longer routes or higher risk.
- Import economics were already weak even before the latest shock.
- **Key risk** – Tighter sourcing and weaker import economics, driven by higher landing costs and lower availability.

Fertilizers

Urea: Gas / feedstock stress

- Urea risk is more about gas availability than finished imports.
- LNG/gas curtailment is already leading to lower utilization / advanced maintenance at some plants.
- As per Mr. Ramesh Chand, acting director and principal economist at the National Centre for Agricultural Economics and Policy Research, we require ~18mn tonnes of urea till Aug'26 – 50% of which is required as a base dose and the remaining 50% used in split doses. Farmers start buying only towards mid-May. Assuming a 20% reduction in monthly Urea production (2mn vs 2.4-2.5mn tonnes), we should be producing close to 10mn tonnes in the next 5 months. Current stock as per government sources is ~6.2mn tonnes. This leaves a gap of close to ~2mn tonnes that needs to be imported.
- Fertiliser production at risk, esp Urea (however can import from Russia as its thru Suez, not SOH: currently it supplies over a third of MOP & 10-15% of Urea & DAP).
- **Key risk** – a managed supply squeeze, not immediate scarcity.

SSP: Input-cost stress / least exposed

- Least exposed finished fertilizer, but it remains vulnerable upstream.
- The key risk is sulphur, which is import-dependent and Gulf-concentrated.
- Makes it more exposed to input-cost inflation and raw material availability than to finished-product shortages.
- Rock phosphate sourcing is relatively better diversified via Morocco / Jordan / domestic suppliers.
- **Key Risk** - Margin risk remains if disruption persists.

Fertilizers

Complex NPK / NP: Multi-input cost stress

- Stacked-risk product. Depends on ammonia, phosphatic inputs, and sulphur simultaneously.
- Exposed to Hormuz-linked ammonia / sulphur, Red Sea-linked Jordanian phosphate, and Atlantic/Cape-linked Moroccan phosphate.
- **Key Risk** - Broad-based cost increase if disruption persists.

Fertilizer Availability (mn tonnes)

(mn tonnes)	Fertilizer Availability as on March 10, 2025	Avg sales in Mar-July period of CY24/CY25
Urea	6.151*	14.318
DAP	2.517	3.316
MOP	1.29	0.814
NPK	5.63	5.877
SSP	2.424	

Source: Government Data, CEIC, DAM Capital Research; *further supply of 1.7mn tonnes scheduled in the pipeline for the next three months

China Tightens Fertilizer Export Restrictions Amid Global Supply Disruptions

- Reportedly, China is tightening fertilizer export restrictions amid disruptions from the war in Iran, raising global prices.
- Exporters are required to suspend shipping of both urea as well as nitrogen-potassium fertilizer blends.
- China is halting most fertilizer exports to secure domestic supply and stabilize prices ahead of spring planting.
- Urea export limits were relaxed last year, but shipments are now suspended. China has had restrictions on urea exports for several years, using an annual quota system to control trade.
- Fertilizer industry groups have urged halting phosphate exports until August'26 to ensure domestic supply.

- Crude-linked packaging costs remain the key monitorable: PET chips, liquid paraffin, HDPE, and flexible laminates — which together account for ~8–15% of total operating costs. Margin impact is likely only if elevated crude prices persist for 1–2 months, allowing higher costs to flow through the system.
- Marico remains relatively cushioned with 1–3 months of inventory, while the ~35% correction in copra prices from peak offers a natural offset. However, liquid paraffin and packaging (~18–20% of RM cost) remain key monitorable for Marico and Dabur.
- For Varun Beverages, the near-term impact appears limited as PET preforms are stocked through April–May, keeping PET chip inflation manageable, while commercial gas costs remain negligible.
- In comparison, Tata Consumer Products appears relatively more exposed given leaner inventory and packaging at ~20% of RM cost, with logistics and certain manufacturing costs also monitorable.
- Historically, palm oil prices tend to follow the trend of crude oil prices, and higher palm oil prices could impact Hindustan Unilever and Godrej Consumer Products. For HUL, soaps are sensitive to palm oil, while detergents are exposed to LAB (Linear Alkyl Benzene), a crude derivative.
- Overall, sectoral margin risk is likely to emerge only if crude prices remain elevated beyond April 2026.

Est. Margin Impact (bps)

Companies	Crude at 85	Crude at 100
Marico	343	598
Tata Consumer	357	624
VBL	280	490
HUL	306	535
Dabur	319	557

- To offset the impact of higher crude-linked input costs, FMCG companies may need to implement price increases across their portfolio. Broadly, a ~3% price hike may be required if crude prices stays ~\$85/bbl (20% up from pre-war period), while a ~5–6% increase could be necessary if crude approaches \$100/bbl (40% up from pre-war period), in order to protect margins from sustained packaging cost inflation.

Infra spending to be hit

- With Indian government likely to bear the majority of the brunt of elevated oil & gas prices, Indian Govt finances for FY27 would be challenged and the >Rs 12 trn capex program would be hit.
- Every \$1/bbl inc. in oil prices impacts Indian Govt's revenues by Rs 100bn. A \$90/bbl avg (vs the \$70/bbl) assumed in the budget would lead to a total impact of Rs 2 trn – Govt would likely balance it between higher fiscal deficit and lower capex spending
- Most Indian infra companies have exposure to ME. With the war, the ordering in the region would likely take a hit. Unlike earlier times, the benefit of higher oil prices is not accruing as crude oil lower volumes from the region are offsetting the higher prices.
- Overall, -ve for Indian infra players.

Upstream oil & gas producing companies benefit while all downstream companies suffer. OMCs have limited pricing power to pass on the elevated oil prices and are the worst impacted companies of the lot. **Earnings volatility summary for every \$ 5/bbl increase oil prices -**

- ONGC, Oil India: EBITDA positively impacted by 11/12%. There is a fear of govt announcing windfall taxes just like during the Russia –Ukraine war however the probability is limited with the ORDA Act.
- HPCL/BPCL/IOCL: EBITDA negatively impacted by 50/44/30% - assuming no change in retail petrol/diesel prices. In absolute terms, \$ 5/bbl impacts the combined annualized EBITDA for OMCs by ~Rs 450bn (FY28 estimate of Rs 1.2 trn)
- IGL, MGL, Ggas: EBITDA negatively impacted by ~ Rs 2/scm (i.e.15-30% of EBITDA for CGDs) - assuming no pass through of price hikes - although some price hikes would likely happen.
- Every \$1/bbl incremental GRM contributes 2.5% to RIL's EBITDA. India Spot GRMs have increased to >\$ 25/bbl vs normalized level of \$ 8/bbl. Petchem margins also to provide additional benefit.

Of the 18 MTPA of Petronet's volumes, company gets ~ 50% from ME. Every 1 MTPA loss of volumes impacts company's EBITDA by Rs 3.5bn.

Of the Qatar's 77 MTPA export facility, 12.8 MTPA (i.e. 17% of total) has been severely damaged and will remain shut for 3-5 years. Doesn't impact India directly as the trains damaged were serving Europe/China. However, this could lead to tightness in the spot LNG prices market that could have secondary effects on the LNG demand in India.

Plastic Pipes

- **Margins:** Margins should ideally be stable. Generally, RM prices get passed on 1:1 and its benefits are visible either through higher than normal volume growth (during price rises) or inventory gains. Astral, Supreme, and Prince are better placed due to their stronger plumbing/fittings mix, while Finolex and Apollo Pipes are more exposed to PVC price risks given higher Agri mix.
- **Volumes:** PVC supply disruptions or significant price hikes could impact volume growth, particularly in the agri segment. Plumbing segment should see less volume impact but may still experience moderate volume moderation if prices rise sharply (channel will go cautious in stocking).
- **Supply Disruption:** India largely imports PVC from the Far East or US, so while logistics disruptions or gas availability issues in these regions may cause delays, it should not be a significant long-term issue. However, mid to long-term disruptions could create supply shortages. Pipe companies with better inventory can hold out for a while, but mid-to-late April could mark the start of resin supply constraints if disruptions persist.

RAC & EMS implications

RAC

- New monitorable for RAC players: LPG shortage to impact RAC industry on LPG shortage which is required for heat exchangers/other components. Limited component inventories and uncertain outlook to impact peak summer production for RAC industry, impacting RAC EMS players more than brands.
- With the current geo-political scenario and limited inventories with the RAC EMS/brands, peak production in Mar-26 could see an impact due to supply challenges with further spillover into 1Q27 if current conditions continue. However, most players are now using alternates like oxyacetylene, PNG etc. We note, industry is also facing a sharp increase in resin prices/
- Apart from the LPG shortage, the RAC industry was already navigating the commodity challenges which its trying to mitigate through price hikes.

EMS implication

- Prolonged closure of airspace/airports in the Middle East can likely impact either export sales or margins for the EMS players in 1Q27. Most players have 15-25% of their sales from exports with Avalon at ~50+%.
- However, there is negligent impact on exports right now as shipments are by sea (not using the impacted route) or air where meaningful impact of higher fares are yet to kick-in. (freight outwards would typically be 1.5-2.5% of sales)
- Another impact could be a disruption in supply chain for key components like semiconductors etc if the far east countries are impacted by oil shortage.

With ~20% increase in crude oil prices, the Indian sugar sector could see two potential positives:

- **Higher global sugar prices:** Global raw and refined sugar prices are currently around 14 US cents/lb (₹29/kg) and USD 420/tonne (₹39/kg), respectively. As the Brazilian crushing season begins in April, higher crude prices could incentivize greater diversion of sugarcane towards ethanol, tightening global sugar supply. A ~10% increase in refined sugar prices could allow Indian mills to export ~0.6–1 MT, versus ~0.3 MT exported so far this season.
- Domestically, sugar production estimates have been revised down to <32 MT (from 35 MT earlier), which could reduce inventories to ~4.5 MT (~2 months of consumption). This may support a ~₹2/kg increase in domestic sugar prices, improving profitability for sugar companies in H1FY27 (Q4FY26 would be weak quarter due to steep increase in Sugarcane prices)
- **Ethanol blending opportunity:** Sustained higher crude prices could prompt the Government of India to accelerate the ethanol blending programme beyond the current 20% level. The introduction of flex-fuel vehicles (similar to Brazil) would be the most effective way to increase blending levels. Higher blending would drive greater distillery utilisation and support long-term profitability for sugar companies and standalone distilleries

- With crude oil prices up ~20%, the supply of MEG and PTA- key raw materials for polyester yarn- from the Middle East has been disrupted, while polyester yarn prices have risen by ₹20–25/kg (~15–20%). Given that manufacturers typically hold 30–40 days of inventory (RM + finished goods), Q4FY26 could see inventory gains for polyester yarn producers.
- The increase in polyester yarn prices has also led to a rise in cotton yarn prices, which could benefit cotton yarn companies in the near term (likely for at least one quarter).
- However, persistently high crude prices could weigh on apparel and yarn demand in the medium term, potentially impacting the sector's growth outlook.

Tiles & Bathware

- **Margins:** 10% increase in gas costs could lead to 70–150 bps EBITDA margin risk for tile players (assuming no pass-through). Large tile players (Kajaria, Somany) and bathware players (Cera) are somewhat better positioned, but still vulnerable due to Morbi-based production exposure.
- **Volumes:** Demand weakness in both tiles and sanitaryware sectors, meaning price pass-throughs will be challenging. Players would try to focus on volume to the extent possible. Morbi-based manufacturers and players with a significant Morbi production exposure (e.g. Kajaria, Somany) are more vulnerable to production disruptions.
- **Supply Disruption:** Gas supply disruptions or high spot LNG prices can significantly impact production for all players. Large players will face the same supply issues as smaller manufacturers, and thus disruption mitigation is largely limited. Morbi-based manufacturers are especially vulnerable to production halts, while larger players with outsourcing flexibility may struggle with passing on increased procurement costs due to weak demand (assuming they do manage to procure.)

Wood Panels

- **Margins:** Energy costs (for pressing and laminating) and resin costs are key factors in margin sensitivity which are linked to crude oil prices. A 10% increase in energy/raw material costs could lead to a 30–60 bps margin risk depending on the company's ability to pass through price hikes. Greenply, Greenlam and Century Ply are better positioned to pass on resin and energy cost inflation due to their brand power in plywood and laminates. Greenpanel relatively less so given higher dependence on MDF (which is largely a B2B product)
- **Volumes:** Volume growth in plywood and MDF may be impacted if cost increases are not absorbed by the end customer.
- **Supply Disruption:** Resin supply disruptions can cause localized production slowdowns. While import dependency on resin (e.g., phenol, melamine) for laminates and particle boards remains to an extent, logistics disruptions and raw material price hikes can strain supply chains. Resin shortages (due to global supply issues) could cause production bottlenecks

THANK YOU

Disclaimer

This document has been prepared by DAM Capital Advisors Limited [the Company/DAM Capital]. DAM Capital is a full-service, integrated investment banking, and institutional broking company. DAM Capital is registered with SEBI as Research Analyst having SEBI Registration number as INH000000131 (BSE RA Enlistment no. 5392).

Disclaimer/Disclosures:

The following disclosures are being made in Compliance with the SEBI Research Analyst Regulations, 2014 and amendments thereof (hereinafter referred to as the "Regulations")

1. DAM Capital the Research Entity (RE) is also engaged in the business of Merchant Banking and Stock Broking and is registered with SEBI for the same.
2. There are no material disciplinary actions taken against DAM Capital as on the date of publication of this report.
3. DAM Capital and associates may from time to time solicit from or perform investment banking or other services for companies covered in its research report. Hence, the recipient of this report shall be aware that DAM Capital may have a conflict of interest that may affect the objectivity of this report. Investors should not consider this report as the only factor in making their investment decision.
4. The RE and/or its associate and/or the Research Analyst(s) may have financial interest or any other material conflict of interest in the company(ies)/ entities covered in this report. Please read this in conjunction with other disclosures herein.
5. An AI tool may have been used in the compilation or collation of publicly available or internally generated research data during the information-gathering process and/or in the summarization of the final report.
6. The RE and/or its associate and/or the Research Analyst or relatives or family members of the Research Analyst may have actual/beneficial ownership exceeding 1% or more of the securities of the company (ies) covered in this report as of the end of the month immediately preceding the date of publication of the research report.
7. A. In the past 12 months period ending on the last day of the month preceding the date of publication of this research report, DAM Capital or any of its associates may have:
 - Received any compensation for merchant banking, stock broking or any other services from the Company covered by this research report;
 - Managed or co-managed public offering of securities of the company covered by this research report
 - Received compensation for products and services other than merchant banking or stock broking services.
- B. DAM Capital or its associates have not received any compensation or any other benefits from the subject company or third party in connection with this research report in the past 12 months period ending on the last day of the month preceding the date of publication of this research report.
